

The Invisible Chasm In the Diploma

How does your major choose your future earnings and unemployment risk?

A university diploma is no longer just a certificate of education; it plays a significant role in finding employment. This study examines 173 different undergraduate programs, comparing the income earned after graduation. It also highlights **income disparities** and **unemployment risks** between these programs.

The data shows that technical fields have very strong job security. In contrast, graduates in creative arts and some social sciences face much higher risks. In fact, their unemployment risk is up to **15 times greater** than in technical fields.

Earnings vs Unemployment Risk by Major

Highlighted majors represent extreme and optimal labor-market outcomes

This graph shows the clear connection between major choice and economic outcomes. Engineering and Health majors stay in the 'optimal zone' with high salaries and low unemployment. On the other hand, Arts and Psychology often fall into the high-risk area with lower pay. This confirms the **'Invisible Chasm'**: while some degrees offer a safe future, others carry much higher economic risks. While some degrees offer a safe future, others carry much higher economic risks. A unique case is Education; these majors provide great job security with minimal unemployment, but they often result in lower median earnings compared to other technical fields

The economic divide is staggering: Petroleum Engineering leads with a **\$125,000 median salary**, while Neuroscience sits at the bottom with **\$35,000**—a nearly **3.5x difference**.
